

Regarding the growing problems concerning energy requirements and the environment, the progress of renewable and green energy-storage devices has captured the ...

Optimizing the economic viability of proton exchange membrane fuel cells operated with oxygen-enriched cathode air for residential hydrogen energy storage systems ...

Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near ...

Rechargeable zinc-air batteries (ZABs) are one of the new energy technologies with great development potential. However, their air electrodes still demand precious metal-based ...

With air storage formed by the shaft well, gravity piston, and seal membrane, the proposed system could achieve constant operating pressure, high storage efficiency, and large storage capacity.

In this paper, a novel energy storage technology of a gravity-enhanced compressed air energy storage system is proposed for the first time, aiming to support the rapid growth of solar and wind capacity. With air storage ...

We explore the challenges and opportunities for electrochemical energy storage technologies that harvest active materials from their surroundings. Progress hinges on ...

Air Products Membrane Solutions was the first to commercialize hollow fiber membranes for nitrogen separation onboard ships and offshore installations. The first on-site nitrogen generation plant using hollow fiber membranes onboard a ...

As a mechanical energy storage system, CAES has demonstrated its clear potential amongst all energy storage systems in terms of clean storage medium, high lifetime scalability, low self-discharge ...

What is the future outlook for liquid air energy storage? The future of liquid air energy storage appears promising, particularly as the demand for diverse and tailored energy ...

LAES-ASU leverages liquid oxygen for cold energy storage, optimizing processes to minimize air separation unit power consumption during peak hours, thereby substantially ...

These developments collectively enhance AABs viability for applications in electric vehicles and renewable energy storage, highlighting the strategic integration of materials science and electrochemical engineering to

address ...

Graphical abstract A novel zinc-air flow battery system with high power density, high energy density, and fast charging capability is designed for long-duration energy storage ...

Zinc-air batteries (ZABs) are being extensively studied as an alternative to lithium batteries due to their high energy density and overall safety benefit. While considerable attention has been ...

Akihide Oogushi, and Takashi Hibino\* Rechargeable proton-exchange membrane batteries that employ organic chemical hydrides as hydrogen-storage media have the potential to serve as ...

Liquid air energy storage (LAES) uses air or nitrogen as both energy storage medium and working fluid. Such a working fluid is directly exhausted during power recovery ...
