

# Application scenario analysis of household energy storage system

How important is application scenario selection & benefit analysis of user-side energy storage?

Therefore, under the price policy and market environment, the application scenario selection and benefit analysis of user-side energy storage are particularly important. Currently, the application and optimization of residential energy storage have focused mostly on batteries, with little consideration given to other forms of energy storage.

Can energy storage equipment improve the economic and environment of residential energy systems?

It is concluded that this kind of energy storage equipment can enhance the economics and environment of residential energy systems. The thermal energy storage system (TESS) has the shortest payback period (7.84 years), and the CO<sub>2</sub> emissions are the lowest.

Can energy storage devices complement the HEMS residential energy management strategy?

In this study, to complement the HEMS residential energy management strategy, we introduce storage devices based on existing target home energy systems. Adding energy storage devices can improve the performance of the PVs and thermal electric pumps in the system, stabilize the system, enhance user economics, and balance grid loads.

What is a household energy storage (HES)?

Surplus energy can be stored temporarily in a Household Energy Storage (HES) to be used later as a supply source for residential demand. The battery can also be used to react on price signals. When the price of electricity is low, the battery can be charged.

What is Community Energy Storage (CES)?

Community Energy storage (CES) is another application of ESS which is seen as a promising option for managing power demand and DERs supply. In ,CES is referred to as 'ESS located at the consumption level with the ability to perform multiple applications with a positive impact for both the consumer as the Distribution System Operator (DSO)'.

Which research model is used to optimize energy storage device configuration?

Table 2 Case introduction. This study involved two main research models, namely, the double-layer optimization model and the comprehensive comparison model. The double-layer optimization model is used to achieve dual optimization of the energy storage device configuration and system energy management.
