Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day⁻¹.

How much does cobalt cost in 2022?

For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in 2022 to about \$30,000 in 2024. Similarly, the price for lithium carbonate has fallen from a high of approximately \$70,000 per metric ton to well below \$15,000 in 2024.

How is lithium nickel manganese cobalt oxide powder produced?

Schematic of a process for the production of lithium nickel manganese cobalt oxide powder. The product stream, a slurry of solid precipitates in a solution, is phase separated, and then filtered and washed several times. The filtration may be done in a rotary vacuum filter followed by drying in a spray dryer.

How much will NMC cathode material cost?

This combination of changes indicates the possibility of the NMC cathode material price approaching \$20 per kg, or 19% less than the base case scenario. There are yet other cost-cutting measures that can drive the cost down even further. Fig. 6.

Why did NCM battery cell prices drop in May?

Asian nickel cobalt manganese (NCM) battery cell prices fell to their lowest level for the first time in over three years in May, retreating significantly from the peak seen in 2022. A combination of lower critical battery raw material prices, supply glut, a sluggish demand and improving technology has kept a tight lid on NCM [...]

Are NCM batteries a good choice for EVs?

This cost advantage makes them a favorable choice for standard- or short-range EVs. In the rapidly evolving EV battery market, specific compositions have taken center stage. In 2021, NCM batteries commanded 58% of the market share, closely followed by LFP and NCA, each holding a 21% share.
