

Can long-term energy storage help save energy?

Solutions for conserving renewable energy abundance are urgently needed in grid regions with substantial wind and solar power volumes. Long-term energy storage (LTES) technologies are significantly helping to ensure the electric grid's resilience, according to Julia Souder, the chief executive of the LTES Council.

Should energy storage be a solution?

Energy storage offers a solution. Capturing and storing excess renewable energy when it is plentiful and releasing it as needed could solve both problems. On sunny and windy days, renewable energy sources can supply energy storage systems, which can be deployed at night, on cloudy days, or when there's less wind.

Are batteries the future of energy storage?

Batteries are at the core of the recent growth in energy storage and battery prices are dropping considerably. Lithium-ion batteries dominate the market, but other technologies are emerging, including sodium-ion, flow batteries, liquid CO₂ storage, a combination of lithium-ion and clean hydrogen, and gravity and thermal storage.

Why is energy storage so important?

There is a growing need to increase the capacity for storing the energy generated from the burgeoning wind and solar industries for periods when there is less wind and sun. This is driving unprecedented growth in the energy storage sector and many countries have ambitions to participate in the global storage supply chains.

What is the future of energy storage?

The future of energy storage is unfolding before our eyes, reshaping how we power our world. It's like watching the early days of smartphones--we know we're witnessing something revolutionary, but the full impact is still unfolding. For those wondering where this technology is heading, the trends are clear and exciting.

Can energy storage be more efficient?

To get on track with global climate targets, the world will need to add 1,500 GW of energy storage capacity to its grids by 2030. Still, the pace of energy storage development is accelerating, and new innovations are emerging that can make the process cheaper, more flexible, and more efficient.
