

Development of pumped water energy storage on uninhabited islands

Can seawater-pumped storage stations offset the shortage of Island power supply?

The emergence of seawater-pumped storage stations provides a new method to offset the shortage of island power supply. In this study, an optimal scheduling of island microgrid is proposed, which uses seawater-pumped storage station as the energy storage equipment to cooperate with wind, photovoltaic and diesel generator.

Should seawater pumped storage stations be built on islands?

Since the ocean may be regarded as an infinite natural reservoir, building seawater-pumped storage stations on islands has some natural advantages. These pumped-storage stations play an auxiliary role in island power supply and can be considered as a new type of energy storage system [11,12].

Can seawater pumped storage station reduce the cost of Island microgrid system?

However, by introducing seawater-pumped storage station, the curtailments of rigid loads and renewable energy were reduced, and the expense growth of island microgrid would become slower. Hence, the scheduling model proposed in this study could reduce the total operation and maintenance costs of island microgrid system obviously.

What is seawater variable-speed pumped storage?

Wave energy is a kind of renewable energy originated from the ocean, but the existing island power supply programs seldom consider this favorable natural condition. In addition, seawater variable-speed pumped storage is a new idea to consume offshore wind power and improve the reliability of coastal and island power systems.

Is seawater pumping an electricity storage solution for photovoltaic energy systems?

Where can seawater pumped storage power plant be located?

Possible locations of seawater pumped storage power plant has been identified and a methodology comprising GIS applications are developed to determine the feasible pump storage sites near the coast of the island.
