

Energy storage and high temperature resistant plastics

Are flexible laminated polymer nanocomposites good for energy storage?

Flexible laminated polymer nanocomposites with the polymer layer confined are found to exhibit enhanced thermal stability and improved high-temperature energy storage capabilities.

Can high Tg polymers achieve high-temperature energy storage performance?

For instance, these polymers can only attain 0.24-0.89 J/cm³; energy storage density at 150 °C, even if they are able to achieve 90% energy storage efficiency (?). Therefore, relying solely on polymers with high Tg cannot effectively achieve superior high-temperature energy storage performance.

Are high-temperature polymers heat-resistant?

In this review, both common high-temperature (>105 °C) polymers and the latest research results are summarized and classified into the heat-resistant insulation grades, this attempt will provide convenience for the selection of high-temperature dielectric materials in different application situations.

Which polymers have low energy storage densities and energy efficiencies?

However, common high-temperature resistant polymers such as polyimide (PI) and polyether sulfone have low energy storage densities and energy efficiencies at high temperature, which are greatly limited in practical applications.

Is PEI-BNNS a high-temperature energy storage material?

The results show that the obtained PEI-BNNS/PP- y wt % HfO₂ /PEI-BNNS composite (abbreviated as BHB-y) is a promising high-temperature energy storage material. BHB-3 achieves the highest Ud of 12.01 J/cm³ and η of 91.05% at a high temperature (150 °C).

Which polymers have high thermal stability?

Linear polymers with high thermal stability, such as polyimide (PI), crosslinked divinyltetramethyldisiloxane-bis (benzocyclobutene) (c-BCB) and polyether sulfone have been developed as high-temperature dielectric materials and used in actual engineering.
