

Energy storage for internal combustion engine electrical equipment

Is DME a good fuel for a CI engine?

DME's lower boiling point and vapour pressure result in a wider spray, better charge mixing, more ignition spots, and complete combustion inside the cylinder. So far, DME has been used as a fuel in a CI engine under conventional combustion and homogeneous charge compression ignition (HCCI) modes and has proved to be a potential fuel for CI engines.

Why should IC engines be combined with electric drives?

Coupling the IC engine to an electric drive allows the ideal functioning of the IC engine to be maintained close to its nominal maximum efficiency point in the frame of hybrid powertrains. It also allows the specific design of engines that do not need important regime and torque variations, permitting BSFC optimization.

How do researchers understand engine and fuel compatibility?

Researchers can understand the engine and fuel compatibility by meticulously modelling engine behaviour and performance with various fuel compositions. This meticulous approach involves simulating complex interactions between fuels and engine components to achieve the following objectives:

Why are fuel cell engines more expensive than IC engines?

Depending on the scenario, rare metals are required to operate many FCVs, often resulting in higher costs than IC engines [11,12]. Over the years, Fuel Cell technology has made steady progress and attained the highest energy efficiency in chemical to electrical energy conversion.

Can IC engines be adapted to biofuels/E-Fuels?

Adaptation of existing IC engines to biofuels/E-fuels has significant scope for advancements in the IC engines so that the advantages of well-defined compositions of these new fuels can be harnessed appropriately to meet the low local and GHG expectations.

What is a DME fuel supply system?

They designed a dedicated DME fuel supply system to enable a higher fuel mass flow rate, overcome vapour lock issues, and compensating for the lower viscosity (DME: <0.1 cSt; Diesel: 3 cSt) and lubricity by adding ~ 1000 ppm lubricity additive (Viscosity 32 cSt at 25°C ; and 898 g/L at 15.6°C) as shown in Fig. 25.
