

Fan speed regulation strategy for energy storage containers

Does airflow organization affect heat dissipation behavior of container energy storage system?

In this paper, the heat dissipation behavior of the thermal management system of the container energy storage system is investigated based on the fluid dynamics simulation method. The results of the effort show that poor airflow organization of the cooling air is a significant influencing factor leading to uneven internal cell temperatures.

Can a battery container fan improve air ventilation?

The existing thermal runaway and barrel effect of energy storage container with multiple battery packs have become a hot topic of research. This paper innovatively proposes an optimized system for the development of a healthy air ventilation by changing the working direction of the battery container fan to solve the above problems.

Does fan direction control improve cooling performance of battery packs?

Cooling performance of battery packs under different design options. In summary, the thermal management strategy based on fan direction control proposed in this paper has significant advantages when thermal management of battery pack groups in energy storage battery systems is performed.

Can CFD simulation be used in containerized energy storage battery system?

Therefore, we analyzed the airflow organization and battery surface temperature distribution of a 1540 kWh containerized energy storage battery system using CFD simulation technology. Initially, we validated the feasibility of the simulation method by comparing experimental results with numerical ones.

How to improve airflow in energy storage system?

The aim of this strategy is to improve the fan state at the top so that the entire internal airflow of the energy storage system is in a circular state with the central suction and the two blowing ends. Optimized solution 4: fans 3 and 9 are set to suction state and the rest of the fans are set to blow state.
