

Why do we need energy storage systems?

When you turn on a hairdryer in your home, somewhere, an electricity generation plant is turning up just a tiny bit to keep the grid in balance. Energy storage systems allow electricity to be stored--and then discharged--at the most strategic times.

What is energy storage?

Energy storage refers to any type of physical or chemical system that stores electrical energy for later use. For example, batteries use chemical energy, which can then be used to power your smartphone, laptop, or electric vehicle.

What is a battery energy storage system?

Battery energy storage systems (BESS) are charged and discharged with electricity from the grid. Lithium-ion batteries are the dominant form of energy storage today because they hold a charge longer than other types of batteries, are less expensive, and have a smaller footprint. Batteries do not generate power; batteries store power.

What happens if you don't have energy storage?

Without energy storage (i.e., how the electric grid has been for the past century), electricity must be produced and consumed exactly at the same time. When you turn on a hairdryer in your home, somewhere, an electricity generation plant is turning up just a tiny bit to keep the grid in balance.

Can water be used to store energy?

The largest CSP facility in the world is in the Mojave Desert in California, and has a capacity of 399 megawatts. Water can be used to store energy too. In fact, pumped storage hydropower (PSH) is the technology behind 93% of all large-scale storage systems in the U.S., and it could become a key player in global energy storage systems.
