

Why do we need a grid-scale energy-storage system?

Under some conditions, excess renewable energy is produced and, without storage, is curtailed<sup>2,3</sup>; under others, demand is greater than generation from renewables. Grid-scale energy-storage (GSES) systems are therefore needed to store excess renewable energy to be released on demand, when power generation is insufficient<sup>4</sup>.

What types of energy storage systems are used in frequency regulation?

PSH and compressed-air energy storage (CAES) are useful in long-duration and seasonal energy storage. Flywheels and electrochemical capacitors (ECs), which can be operated at high power for many cycles, are mainly used in frequency regulation<sup>9,219</sup>.

Do off-grid systems affect power quality?

On the other hand, since the scale of off-grid systems is smaller than that of conventional systems, the frequency and voltage of off-grid systems tend to fluctuate more. When renewable energy sources are used as a power source for off-grid systems, the negative impact on power quality becomes more pronounced due to variations in output.

What is an off-grid system?

Finally, Section 6 presents a brief conclusion to this paper. An off-grid system is a distribution system that aims at local production and local consumption of electricity and has been studied in recent years. The off-grid system supplies the necessary power within the region using distributed power sources derived from renewable energy and BESS.

Are battery energy-storage technologies necessary for grid-scale energy storage?

The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However, this technology alone does not meet all the requirements for grid-scale energy storage.

Can battery storage provide electricity for off-grid areas?

Battery storage with high safety, long service life and maintenance-free property could be a solution to provide storage and supply electricity for off-grid areas (Fig. 3). In these cases, the local temperature needs to be considered, especially in areas with low temperatures below  $-20\text{ }^{\circ}\text{C}$  or high temperatures over  $50\text{ }^{\circ}\text{C}$ .
