

How can a multi-microgrid energy real-time optimal control scheduling strategy be implemented?

A multi-microgrid energy real-time optimal control scheduling strategy is proposed. Energy storage devices can actively participate in optimal energy scheduling. Improved resilience and flexibility of energy dispatch for multiple microgrid. Significantly reduce the number of microgrid connections to the distribution grid.

What is the dispatching strategy of multi-microgrid energy control center?

The multi-microgrid system is in a state of one surplus and two shortages, that is, there is one surplus microgrid and two power-deficit microgrids, and then the dispatching strategy of the multi-microgrid energy control center when P_{bCt} is positive and P_{bAt} and P_{bBt} is negative is taken as an example to illustrate:

What is adaptive distributionally robust dispatch (DRD) of a multi-energy microgrid?

This paper studies adaptive distributionally robust dispatch (DRD) of the multi-energy microgrid under supply and demand uncertainties. A Wasserstein ambiguity set is constructed to support data-driven decision-making.

Can energy storage devices control multi-microgrid energy?

Subsequently, it proposes a real-time optimal control and dispatching strategy for multi-microgrid energy based on storage collaborative. This model considers the energy storage device as an energy management controller, enabling it to participate in the energy collaborative dispatch of multi-microgrid.

How to solve economic dispatching problem of a microgrid?

The economic dispatching problem of the microgrid is solved using ICO with 500 iterations, and the same problem is also solved using four other optimization algorithms: gray wolf optimization (GWO), particle swarm optimization (PSO), CO, and ICO.
