

Are battery energy storage systems safe?

WASHINGTON, D.C., March 28, 2025 -- Today, the American Clean Power Association (ACP) released a comprehensive framework to ensure the safety of battery energy storage systems (BESS) in every community across the United States, informed by a new assessment of previous fire incidents at BESS facilities.

What happens if a battery energy storage system is damaged?

Battery Energy Storage System accidents often incur severe losses in the form of human health and safety, damage to the property and energy production losses.

How to reduce the safety risk associated with large battery systems?

To reduce the safety risk associated with large battery systems, it is imperative to consider and test the safety at all levels, from the cell level through module and battery level and all the way to the system level, to ensure that all the safety controls of the system work as expected.

Why do we need a safer battery system?

The demand for secondary batteries has significantly increased due to the growth of the electric vehicle and energy storage system industries. However, social concerns about the rise in battery-related fire incidents require safer battery systems.

What happens if an energy storage system fails?

Any failure of an energy storage system poses the potential for significant financial loss. At the utility scale, ESSs are most often multi-megawatt-sized systems that consist of thousands or millions of individual Li-ion battery cells.

Are high-energy-density lithium-ion batteries safe?

The widespread use of high-energy-density lithium-ion batteries (LIBs) in new energy vehicles and large-scale energy storage systems has intensified safety concerns, especially regarding the safe and reliable operation of large battery packs composed of hundreds of individual cells.
