

Nickel manganese cobalt battery project financing options in Peru 2030

Can battery manufacturers securing supply of essential battery raw materials by 2030?

Based on current market observations, battery manufacturers can expect challenges securing supply of several essential battery raw materials by 2030, McKinsey's report finds. Battery makers use more than 80% of all lithium that is mined today, and that share could grow to 95% by 2030.

Does cobalt supply meet IEA demand scenarios for the year 2030?

Cobalt supply projection scenarios against the backdrop of IEA demand scenarios for the year 2030. Moving to the Optimistic Scenario (OS) estimates, which is a more ambitious outlook, cobalt supply at 376.2 kt, not only meets but also exceeds the needs of the Stated Policies and Announced Pledges Scenarios (285 kt).

How much nickel can be recovered from NMC batteries?

Current recycling technologies can recover 84 % and 16 % of the nickel from spent NCA and NMC batteries, respectively. Overall, the nickel demand in the battery sector is expected to grow by 58 % from 2010 to 2030 . 2.2.

Will cobalt and nickel be more important in 2021?

As the International Energy Agency notes in their 2021 report 'The Role of Critical Minerals in Clean Energy Transitions', cobalt supply will need a 42 times increase in supply, and nickel a 19 times increase, to reach the goals of the COP21 Paris Agreement.

Will manganese demand outpace the demand for battery-grade materials?

Meanwhile, the supply of manganese is projected to grow moderately through 2030, but an increasing demand for battery-grade material is likely to outpace supply, requiring the development of new refineries.

Does the optimistic scenario meet the IEA's projected demand for cobalt?

The supply scenarios presented, particularly the Optimistic Scenario, do not meet the IEA's projected demand for copper in the Net Zero Emissions by 2050 scenario, indicating a pressing need for policy intervention. Our study's positive outlook on cobalt aligns with recent literature advocating for low/zero-cobalt batteries [59,60].

The purpose of using Ni-rich NMC as cathode battery material is to replace the cobalt content with Nickel to further reduce the cost and improve battery capacity.
