

What happens after a peak-valley electricity investment?

After the investment, the firms obtain profits through the peak-valley electricity price spreads. They face a choice between making this irreversible investment and holding an option to delay the investment because of the uncertainty in the future price spreads.

What causes a peak-valley spread?

The current peak-valley spread can be attributed to a combination of electricity supply and demand, as well as market mechanisms, which are characterized by significant volatility.

How can China reduce peak-valley spread?

For example, if the Chinese government shocks the market by announcing a 30% subsidy immediately and promises no subsidy in the near future, it can lower the peak-valley spread threshold from 0.9928 to 0.5978 RMB/kWh (or a 39.8% reduction).
