

Principle of dynamic capacity expansion of energy storage cabinet

Why is capacity expansion modelling important in energy-system decarbonization?

As grid planners, non-profit organizations, non-governmental organizations, policy makers, regulators and other key stakeholders commonly use capacity expansion modelling to inform energy policy and investment decisions, it is crucial that these processes capture the value of energy storage in energy-system decarbonization.

What is a capacity expansion model for multi-temporal energy storage?

This paper proposes a capacity expansion model for multi-temporal energy storage in renewable energy base, which advantages lie in the co-planning of short-term and long-term storage resources. This approach facilitates the annual electricity supply and demand equilibrium at renewable energy bases and reduces the comprehensive generation costs.

Can energy storage be expanded across different thermal power units?

With a step length of 500 MW, capacity expansion planning for energy storage is conducted across varying thermal power capacities. The results are shown in Fig. 10. Fig. 10. Planning results of energy storage under different thermal power unit capacities.

What is the power capacity ratio of short-term to long-term energy storage?

Case studies indicate that when this weighting reaches 0.8, the power capacity ratio of short-term to long-term energy storage will achieve parity at 1:1, and the combined capacity will be approximately 27.5 % of the installed renewable energy capacity.

Why is multi-temporal energy storage important under low-carbon policies?

Under low-carbon policies, the capacity of thermal power is often planned in advance, making the coordinated planning of multi-temporal energy storage an essential issue for the secure and efficient operation of renewable energy bases.

How does thermal power unit capacity affect energy storage?

Planning results of energy storage under different thermal power unit capacities. Fig. 10 reveals that as the capacity of thermal power units is reduced, renewable energy bases become increasingly reliant on short-term energy storage.
