

The problem of electrochemical energy storage power station being too large

Is excessive energy storage a threat to China's power system?

But the risks for power-system security of the converse problem -- excessive energy storage -- have been mostly overlooked. China plans to install up to 180 million kilowatts of pumped-storage hydropower capacity by 2030. This is around 3.5 times the current capacity, and equivalent to 8 power plants the size of China's Three Gorges Dam.

How to reduce the safety risk of electrochemical energy storage?

The safety risk of electrochemical energy storage needs to be reduced through such as battery safety detection technology, system efficient thermal management technology, safety warning technology, safety protection technology, fire extinguishing technology and power station safety management technology.

Is excessive energy storage a problem?

Spyros Foteinis highlights the acknowledged problem that an insufficient capacity to store energy can result in generated renewable energy being wasted (Nature 632, 29; 2024). But the risks for power-system security of the converse problem -- excessive energy storage -- have been mostly overlooked.

Why is energy storage oversupply a problem?

The expansion is driven mainly by local governments and lacks coordination with new energy stations and the power grid. In some regions, a considerable storage oversupply could lead to conflicts in power-dispatch strategies across timescales and jurisdictions, increasing the risk of system instability and large-scale blackouts.

How has electrochemical energy storage technology changed over time?

Recent advancements in electrochemical energy storage technology, notably lithium-ion batteries, have seen progress in key technical areas, such as research and development, large-scale integration, safety measures, functional realisation, and engineering verification and large-scale application function verification has been achieved.

Why do energy storage stations have different voltage levels?

The situation is further complicated by electrochemical-energy storage stations that operate at different voltage levels, hindering the suppression of fluctuations caused by inherently variable energy sources, such as wind and sunlight. Expansion of the capacity to generate energy must align with the capacity to store it.
