What is thermal energy storage?

Thermal energy storage (TES) is the storage of thermal energy for later reuse. Employing widely different technologies, it allows surplus thermal energy to be stored for hours, days, or months. Scale both of storage and use vary from small to large - from individual processes to district, town, or region.

How does the Solana Generating Station work?

Construction of the salt tanks at the Solana Generating Station, which provide thermal energy storage to allow generation during night or peak demand. The 280 MW plant is designed to provide six hours of energy storage. This allows the plant to generate about 38 percent of its rated capacity over the course of a year.

What are the characteristics of thermal storage power plants?

They must be energy efficient and cost-effective in spite of low annual utilization rates (equivalent full load hours). Thermal Storage Power Plants comply with the abovementioned characteristics, are based on state-of-the-art technology and are on the verge of being realized in first-of-a-kind pilot plants.

How can thermal storage power plants reduce the residual load gap?

The following key measures were introduced for its realization: 1. Introducing Thermal Storage Power Plants (TSPP) with about one third annual photovoltaic electricity share will reduce the need of renewable fuels for firm and flexible power generation to close the residual load gap.

What is high-temperature thermal energy storage (HTTES) heat-to-electricity (CSP)?

High-temperature thermal energy storage (HTTES) heat-to-electricity TES applications are currently associated with CSP deployments for power generation. TES with CSP has been deployed in the Southwestern United States with rich solar resources and has proved its value to the electric grid.

Why is bioenergy used in thermal storage power plants?

Bioenergy is used as primary fuel for Thermal Storage Power Plants in order to guarantee firm power capacity at any time just on demand in order to close the residual load gaps of the power sector. PV and energy storage integrated to TSPP save as much biofuel as possible in order to reduce the pressure on the limited available bioenergy resources.
