Can a gravity energy storage system be built using abandoned mines?

The Gravitricity project has validated the feasibility of constructing gravity energy storage systems using abandoned mines. S-SGES offers advantages such as high response speed and long service life, making it an ideal solution for grid frequency regulation and integration with renewable energy storage.

How does gravity energy storage work?

Its working principle is similar to that of tower-based gravity energy storage, except that this system employs natural underground shafts or abandoned mines to lift heavy weights. This approach fully leverages existing underground spaces, reduces construction costs, and minimizes surface land occupation.

How efficient is a gravity energy storage system?

The system's overall round-trip efficiency ranges between 70 and 75%. The entire process is chemical-free and environmentally friendly. Suitable for mountainous areas and abandoned mines, several pilot projects of rail-mounted gravity energy storage systems have already been implemented.
