Is there a cooperative operation strategy for MMG and electric vehicle charging stations?

To address these issues, this paper proposes a cooperative operation strategy for MMG and electric vehicle charging station (EVCS) considering the SES characteristics of electric vehicles (EVs).

Do electric vehicles need energy storage?

In order to greatly reduce fuel consumption and pollutant emissions, when large-scale electric vehicles are connected to the grid for charging, it is necessary to fully consider the energy storage of electric vehicle batteries.

Why should large-scale electric vehicles be connected to the power grid?

When large-scale electric vehicles are connected to the power grid, if they make full use of their energy storage. The orderly interaction with the power grid under the optimized dispatch strategy can not only transfer the peak load of the power grid, make the power grid run smoothly, but also increase the benefits of electric vehicle users.

Can energy storage systems be used for EVs?

The emergence of large-scale energy storage systems is contingent on the successful commercial deployment of TES techniques for EVs, which is set to influence all forms of transport as vehicle electrification progresses, including cars, buses, trucks, trains, ships, and even airplanes (see Fig. 4).

What is a multi-vector energy storage system?

This multi-vector energy storage system allows for independent storage of both electrical and thermal energy, minimising inter-exchange between energy forms and thus reducing energy waste during the conversion process.

What are the different types of storage scenarios?

Among them, there are three single storage scenarios: (1) Battery storage; (2) Pumped storage; (3) Electric vehicles. Dual storage scenarios include: (1) Battery storage and pumped storage; (2) Battery storage and electric vehicles; (3) Pumped storage and electric vehicles.
