Can energy management systems save energy in elevator systems?

To achieve notable energy savings, modern Energy Management Systems (EMS) can play a significant role in this field. This work focuses on implementing an energy recovery system (ERS) for elevator systems deployment.

How to recover energy from elevator systems?

Energy recovery from elevators' systems is proposed. Energy storage using supercapacitors and lithium-ion batteries is implemented. Bidirectional power flow is controlled to use the stored energy as auxiliary supply to the load without exchanging with the grid. Emergency energy level is maintained and used in automatic rescue situation.

Why is energy recovery important in elevators & auxiliary power supply systems?

Energy recovery in elevators' systems is vital to achieve higher efficiency. Leaps in power electronics industry enables complex and tight control algorithms for energy recovery and harvesting. Energy recovery and auxiliary power supply system is proposed and analyzed in this manuscript.

How can regeneration in elevators save energy?

Regeneration in elevators can considerably save 20% to 40% energy usage if its coupled with efficient control and storage techniques. Conventional elevator systems consist of a car, a machine and a counterweight. The counterweight is designed to balance the weight of a half-loaded car.

How much energy do elevators use?

During peak hours, elevators may constitute up to 40% of the building's electricity demand. In New York City, the estimated daily energy consumption of elevators is 1945 MWh on weekdays, with a peak demand of 138.8 MW, and 1575 MWh during a weekend, with a peak demand of 106.0 MW.

What is the proposed arrangement for the lift energy storage system?

An example of the proposed arrangement is presented in Table 1. Energy is stored as potential energy by elevating storage containers with an existing lift in the building from the lower storage site to the upper storage site. Electricity is then generated by lowering the storage containers from the upper to the lower storage site.
