

What are the soda ash energy storage batteries

Is soda ash a good substitute for lithium?

Instead of lithium, this nascent battery tech uses a sodium compound called soda ash, which can be produced using table salt. Unlike lithium, sodium is easily accessible everywhere. Even better for the U.S. is that China must synthesize soda ash from salt, while it is cheap and plentiful here.

How much would soda ash cost in Wyoming?

Wyoming has 47 billion tons of mineable soda ash in the Green River basin. There would be hundreds of TWH of power storage from each billion tons of soda ash. Based on material costs of \$4 per kWh there could be \$8 to \$10 per kWh sodium ion batteries in the future. This would be ten times cheaper than energy storage batteries today.

Can a sodium ion battery replace a lithium battery?

Sodium-ion batteries can only partially replace lithium-ion batteries in certain areas. Lithium-ion batteries have inherent advantages that sodium-ion cannot match, such as energy density. With lithium-ion batteries reaching energy densities of 250-300 Wh/kg, vehicles can travel further, and 3C electronics like smartphones last longer.

How much power does a sodium battery produce?

The first factory has about a 40 GWh per year capacity. China has 16 out of 20 globally planned or built sodium battery factories according to Benchmark Minerals. CATL's first-generation sodium battery generates 160-watt-hours per kilogram. This is 10% less energy than iron LFP batteries and 40% less than mass produced nickel batteries.

How much energy does a first-generation sodium battery produce?

CATL's first-generation sodium battery generates 160-watt-hours per kilogram. This is 10% less energy than iron LFP batteries and 40% less than mass produced nickel batteries. CATL plans to increase the energy density of next generation sodium ion to 200 Wh/kg.
