What is a high-temperature solar power plant?

The energy source in a high-temperature solar power plant is solar radiation. Meanwhile, a conventional thermal power plant uses fossil fuels such as coal or gas. The source of energy is the main difference between conventional thermal power plants, and then all types of thermoelectric plants work similarly:

What is high-temperature solar thermal (HTST)?

High-temperature solar thermal (HTST), also known as concentrating solar thermal (CST), is a technology used for electrical power generation. HTST power plants are similar to traditional fossil fuel power plants, but they obtain their energy input from the sun instead of from fossil fuels.

How can a solar thermal power plant withstand a high temperature?

Together with industrial partners, we transfer innovations from the laboratory to large-scale applications. New heat transfer and storage media can withstand temperatures of 600 °C, higher than has previously been possible in solar thermal power plants. This increases the efficiency of converting solar radiation into heat and then into electricity.

Why do power plants need integrated heat storage systems?

Integrated heat storage systems make it possible for the power plant to generate electricity exactly when it is needed, regardless of fluctuations in the intensity of the solar radiation over the course of the day. Longer periods of low irradiation can be bridged using fossil or regenerative fuels.

Can thermal energy storage systems be used for CSP plants?

Thermal energy storage systems for CSP plants have been investigated since the start of XXI century. Solar power towers have the potential for storing much more heat than parabolic trough collectors.

Why are solar thermal power plants important?

Since solar thermal power plants can feed their electricity into the power grid even after sunset, they are of particular value for an energy system based on renewable energy sources. Solar thermal power plants are of strategic importance in sunny countries to be able to phase out coal and gas power plants in the future.
